EXAMINER

SCHNIZER, RICHARD A

ART UNIT PAPER NUMBER

1635

DATE MAILED: 04/06/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/972,245

Applicant(s)

ROBERTS ET AL

Examiner

Richard Schnizer, Ph. D

Art Unit

1635

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 12 January 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-41 is/are pending in the application.
- 4a) Of the above claim(s) 16, 17 and 23-40 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-13, 17-22 and 41 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 January 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 1/12/05 has been entered.

Claim 41 was added as requested.

Claims 1-41 are pending in the Application.

Claims 1-13, 17-22, and 41 are under consideration in this Office Action. Claims 14-16 and 23-40 are withdrawn as being drawn to non-elected subject matter. Linking claims 1-6 and 17-19 are considered to the extent that they embrace the elected invention.

### ***Rejections Withdrawn***

The rejection of claims 1, 2, 5-13, and 17-21 under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement is withdrawn in view of Applicant's amendments.

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

Art Unit: 1635

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-13, 17-22, and 41 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1-13, 17-22, and 41 are indefinite because they recite "the biological activity" without antecedent basis in steps (a)-(e). The claim does not specify any particular biological activity, or require that a therapeutic can have only one biological activity. So, one of skill in the art cannot know to which biological activity the claims refer. For example, the specification at paragraph 43 states "biological activity" means any cellular or physiological response or reaction that that agent causes, either directly or indirectly, and that the biological activity is not necessarily the same activity as the therapeutic benefit that the agent bestows upon the subject. So, the therapeutic agents of the invention may possess more than one biological activity, and it is unclear to which activity the claims refer.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 7, 9, 10, 17, 18, and 41 are rejected under 35 U.S.C. 102(b) as being anticipated by Chinol et al (British Journal of Cancer 78(2): 189-197, 1998).

Chinol taught a method of assaying the effects on immunogenicity, pharmacokinetics and biodistribution of biochemical modifications to the polypeptide streptavidin. Streptavidin (Mr 66 kDa) was modified with monomethoxypolyethylene glycol (mPEG) to varying extents (mean values of 3, 7, or 15 mPEG chains per polypeptide (see Table 1 on page 192). Each modified polypeptide was administered to a group of 5-6 subjects on days 0, 10, 16, and 51 in an excipient comprising 10 mM phosphate buffer. Blood was drawn from each subject on days 10, 16, 23, and 76 and tested for anti-avidin reactivity by ELISA. See paragraph bridging columns 1 and 2 on page 190; page 192, column 2, first full paragraph; and page 194, column 1, second and third full paragraphs. Anti-avidin reactivity is a measure of the antigenicity of the modified avidins, which in turn is considered to be a biological activity as recited in the claims. Pharmacokinetics and tissue distribution of each modified avidin were also measured. Chinol concluded that avidin modified with 7 mPEG chains was most suitable for therapeutic applications. See abstract. Pertinent to claim 9, Chinol taught that avidin is used in cancer therapy. See abstract.

Thus Chinol anticipates the claims.

Claims 1-3, 7, 9, 10, 17, 18, and 41 are rejected under 35 U.S.C. 102(a) as being anticipated by Deckert et al (Int. Journal of Cancer 87:382-390, 2000).

Deckert taught a method of assaying immunogenicity, pharmacokinetics and microdistribution of PEG-modified humanized A33 antibody. The A33 antibody is used to target colon cancer tumors. See title and abstract. A33 antibodies were modified with 5kDa or 20 kDa methoxy-PEG-succinimidyl-succinate and administered to groups of 5 mice each in weeks 0, 1, 2, and 3. Blood was drawn in weeks 5, 9, and 13, and anti A33 antibody binding activity was assayed in the serum. See paragraph bridging pages 384 and 385, and Fig. 3 on page 385. This is taken as an indirect measure of the biological activity (antigenicity) of the modified A33 antibodies. So, Deckert teaches a method in which differently pegylated antibodies are administered to subjects, followed by booster doses, and measures of antigenicity. It is noted that Deckert does not teach an assay of activity prior to the booster dose. However, the instant claims are not limited to such a sequence of events, and embrace the sequence taught by Deckert.

Thus Deckert anticipates the claims.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 5-7, 9, 10, 12, 13, 17, and 41 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alvarez et al (Med. Pediatr. Oncol. 34(3): 200-205, 2000) in

view of Graham et al (Bone Marrow Transplant (21(9): 879-885, 1998), and Francis et al (Int. J. Hematol. 68(1): 1-18, 1998).

Alvarez disclosed a comparative study of the effects of pegylated asparaginase relative to those of native asparaginase. Patients were given at least two doses of pegylated asparaginase. See Fig.1 on page 202. Pegylated asparaginase caused toxicity including nausea, vomiting and pancreatitis in greater than half of recipients being treated for ALL. Patients were monitored by sequential serum amylase and lipase determinations. See abstract.

Alvarez did not teach the comparison of two different types of pegylated asparaginase.

Graham disclosed a clinical trial of pegylated asparaginase in the treatment of acute lymphoblastic leukemia (ALL). Patients received between 1 and 12 doses of pegylated asparaginase. Patients were monitored for relapse throughout the course of treatment. This is considered to amount to an assay of biological activity of the drug. Most of the patients who received the drug developed toxicities which resulted in abbreviated courses of administration. Symptoms included nausea, vomiting, and pancreatitis. See abstract. Evaluations of toxicity are also considered to be measurements of biological activity.

Francis taught that pegylation of protein drugs can cause toxicity. See sentence bridging columns 1 and 2 on page 4, and first sentence of paragraph bridging pages 7 and 8. Francis also teaches that bioactivity, stability, immunogenicity, and toxicity may be affected by the way in which a protein drug is pegylated. See abstract,

and pages 2-4. Important considerations include the site of attachment of PEG, the degree of modification, the coupling chemistry chosen, the presence or absence of a linker, and generation of harmful co-products. See page 3, column 2, first full paragraph. Francis teaches that the appropriate pegylation method is generally determined empirically by examining a range of different degrees of substitution, as well as different coupling techniques. See page 6, column 1, first full paragraph. The bioactivity retention and other functions of the products may be assessed as a mixture, or individual members of a pegylation series may be assayed individually. See e.g. page 6, first full paragraph of column 1.

At the time the invention was made, pegylation of asparaginase was seen to have both advantages (increased half-life and reduced immunogenicity) and disadvantages (increased toxicity). It would have been obvious to one of ordinary skill in the art at the time of the invention to produce a variety of differently pegylated versions of asparaginase, because Francis suggests that positive attributes of pegylated drugs can be maximized, while minimizing negative attributes, by determining the optimum pegylation conditions. See abstract. It would have been obvious to then compare and test the resulting pegylated forms of asparaginase. It is clear that it was routine in the art to compare different forms of asparaginase in head to head studies in vivo as taught by Alvarez. It would have been similarly obvious to measure the effects of the drugs after each injection, as patients undergoing treatment for ALL, such as those in the Graham and Alvarez studies, are continuously monitored for disease progress. Claim 5 is included in this rejection because in light of the teachings of

Francis, the extent of pegylation is a result-effective variable that is routinely optimized by those of skill in the art. See page 3, column 2, first full paragraph. Claim 6 is included in this rejection because the selection of different coupling chemistries is part of the optimization process suggested by Francis, and different chemistries result in different modifying agents. For example, in the TMPEG method discussed at page 5, the PEG is linked to the polypeptide directly without any linker, whereas other chemistries may cause the introduction of immunogenic groups (see e.g. page 4, column 1, lines 1-10 of first full paragraph).

Thus the invention as a whole was prima facie obvious.

Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Alvarez, Graham, and Francis, as applied to claims 1-3, 5-7, 9, 10, 12, 13, 17, and 41 above, and further in view of Petersen et al (US Patent 6,531,122)

The teachings of Alvarez, Graham, and Francis are summarized above and can be combined to render obvious methods of synthesizing and comparing differently pegylated asparaginases. Francis also teaches that one reaction chemistry known in the art for PEG modification utilizes a cyanuric chloride linker. See page 4, lines 5-9 of first full paragraph.

These references do not teach SBA-, SC-, and ALD-PEGs.

Petersen teaches that SBA-, SC-, and ALD-PEGs, as well as a variety of other types of modified PEGs, including those with a cyanuric chloride linker, may be used interchangeably to modify polypeptide drugs. See paragraph bridging pages 24 and 25;

Art Unit: 1635

column 25, first full paragraph, especially, lines 12, 27, 28, and 30; and column 26, lines 36-42.

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify asparaginase with any of SBA-, SC-, and ALD-PEGs, because these derivatives were well known equivalents in the prior art. MPEP 2144.06 indicates that when it is recognized in the art that elements of an invention can be substituted, one for the other, while retaining essential function, such elements are art-recognized equivalents. An express suggestion to substitute one equivalent component or process for another is not necessary to render such substitution obvious. *In re Fout*, 675 F.2d 297, 213 USPQ 532 (CCPA 1982).

Thus the invention as a whole was *prima facie* obvious.

Claims 8, 11, and 20-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alvarez, Graham, and Francis, as applied to claims 1-3, 5-7, 9, 10, 12, 13, 17, and 41 above, and further in view of Roberts et al (J. Gen. Virol. 72:299-305, 1991).

The teachings of Alvarez, Graham, and Francis are summarized above and can be combined to render obvious methods of synthesizing and comparing differently pegylated asparaginases.

These references do not teach an enzyme used to treat viral infection, used to reduce glutamine levels, or asparaginase glutaminase from *Pseudomonas*.

Roberts teaches that glutaminase asparaginase from *Pseudomonas* can be used to treat retroviral disease by repeated administration, and that pegylation of the enzyme increases its half-life several fold. See abstract, and page 304, penultimate sentence of column 1.

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify *Pseudomonas* asparaginase glutaminase by pegylation. One would have been motivated to do so in order to increase its half-life in vivo and to decrease its immunogenicity, as taught by both Roberts and Francis. It would have been similarly obvious to optimize the pegylation conditions as taught by Francis. In doing so it would have been obvious to deliver differently pegylated forms of the enzyme in vivo over the course of treatment taught by Roberts. It would have been obvious to monitor the progress of the disease over the course of treatment in view of the teachings of Alvarez and Graham, who show that this is routine in the art.

Claims 18 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alvarez, Graham, and Francis, as applied to claims 1-3, 5-7, 9, 10, 12, 13, 17, and 41 above, and further in view of Bollin et al (US Patent 4,678,812, issued 7/7/87).

The teachings of Alvarez, Graham, and Francis are summarized above and can be combined to render obvious methods of synthesizing and comparing differently pegylated asparaginases.

These references do not teach adding an excipient that protects asparaginase during lyophilization.

Bollin teaches that proteins can be stabilized by lyophilization and that saccharides are useful in stabilizing asparaginase during lyophilization.

It would have been obvious to one of ordinary skill in the art to add saccharides to the pegylated asparaginases developed by the methods described above, for the purpose of stabilizing them during lyophilization. One would have been motivated to do so because Bollin teaches that proteins may be stabilized by lyophilization, and that asparaginase in particular is stabilized by addition of saccharides during lyophilization.

Thus the invention as a whole was prima facie obvious.

### ***Response to Arguments***

Applicant's arguments filed 1/12/05 have been fully considered but they are not persuasive.

Applicant addresses the 103 rejections at pages 9-12 of the response. At page 9 Applicant argues that none of the cited references disclose administering a second modified therapeutic agent to a subject and assaying the biological activity of the agent after administration and after a booster dose.

This is unpersuasive because it is clear from the teachings of Francis that bioactivity, stability, immunogenicity, and toxicity may be affected by the way in which a protein drug is pegylated, and that the appropriate pegylation method is generally determined empirically by examining a range of different degrees of substitution, as well as different coupling techniques. See abstract; pages 2-4; and page 6, column 1, first full paragraph. Therefore it is obvious to compare differently pegylated proteins.

Furthermore, the prior art teaches that it was routine to compare pegylated versus non-pegylated proteins in vivo, and to perform repeated administrations of each drug. Given these teachings, it would have been obvious to compare differently pegylated forms of asparaginase in vivo. It is also clear that evaluation of asparaginases was routinely performed by assays of various biological activities such as toxicity and anti-cancer effects. See e.g. Alvarez and Graham above.

At pages 9 and 11 of the response Applicant asserts that none of the references suggests or discloses comparing the biological activity of differently modified therapeutic agents to select modification conditions that prevent host mediated inactivation. This is unpersuasive because it was well known in the prior art that host mediated inactivation of protein drugs was a problem that led to reduced circulation time and reduced effectiveness, and that one of the purposes of pegylation was to reduce host mediated inactivation. See e.g. Francis (1998) page 2, column 1, second full paragraph, and following items 1, 2, 4, 5, and 6. It is apparent that one purpose of the Francis article is to show that the type of pegylation used affects such factors as retention of bioactivity, stability, and immunogenicity. See abstract. Therefore, it was obvious that one of the purposes for comparing differently pegylated proteins was to select conditions that minimized host-mediated inactivation.

At page 12 of the response, Applicant asserts that the Examiner has provided no motivation to combine the references. This is unpersuasive because MPEP 2144 states that the rationale to modify or combine the prior art may be reasoned from knowledge generally available to one of ordinary skill in the art or established scientific principles.

In this case, it is clear that at the time of the invention it was routine in the art to compare differently pegylated proteins, it was recognized that pegylation could decrease host mediated inactivation of protein drugs, and it was routine to measure bioactivity of pegylated asparaginase in vivo. This generally available knowledge, in view of the level of skill in the art, is sufficient to allow the combination of references that renders the invention obvious.

For these reasons, the rejections are considered proper. Note that the Abshire reference has been removed from the rejections. This is because although it provides evidence that the problem of asparaginase immunogenicity was well recognized in the prior art, the reference was not deemed necessary in order to make the rejections.

### ***Conclusion***

No claim is allowed.

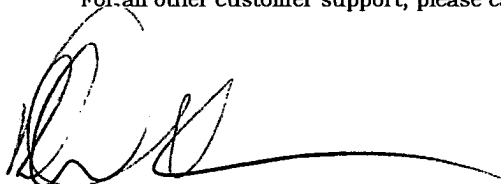

Any inquiry concerning this communication or earlier communications from the examiner(s) should be directed to Richard Schnizer, whose telephone number is 571-272-0762. The examiner can normally be reached Monday through Friday between the hours of 6:00 AM and 3:30. The examiner is off on alternate Fridays, but is sometimes in the office anyway.

If attempts to reach the examiner by telephone are unsuccessful, the Examiner's supervisor, Andrew Wang, can be reached at (571) 272-0811. The official central fax number is 703-872-9306. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to (571) 272-0547.

Art Unit: 1635

Patent applicants with problems or questions regarding electronic images that can be viewed in the Patent Application Information Retrieval system (PAIR) can now contact the USPTO's Patent Electronic Business Center (Patent EBC) for assistance. Representatives are available to answer your questions daily from 6 am to midnight (EST). The toll free number is (866) 217-9197. When calling please have your application serial or patent number, the type of document you are having an image problem with, the number of pages and the specific nature of the problem. The Patent Electronic Business Center will notify applicants of the resolution of the problem within 5-7 business days. Applicants can also check PAIR to confirm that the problem has been corrected. The USPTO's Patent Electronic Business Center is a complete service center supporting all patent business on the Internet. The USPTO's PAIR system provides Internet-based access to patent application status and history information. It also enables applicants to view the scanned images of their own application file folder(s) as well as general patent information available to the public.

For all other customer support, please call the USPTO Call Center (UCC) at 800-786-9199.

A handwritten signature in black ink, appearing to read 'Richard Schnizer', with a long horizontal flourish extending to the right.

Richard Schnizer, Ph.D.
